

Matsu: An Elastic Cloud Connected to a SensorWeb for Disaster Response

(Session 12F Working Group: **Cloud Computing for Spacecraft Operations**)

Daniel Mandl - NASA/GSFC

3/2/11

The banner for the Ground System Architectures Workshop features a red border. Inside, there's a teal graphic on the left with a satellite icon. The main text area has a white background with a grey swoosh graphic on the right. The AEROSPACE logo is at the top right.

Sample of Planned Addition of Higher Resolution Flood Product Overlay Using EO-1

EO-1 Land Cover Land Use Change

ALI Imagery of Australian Flood (Mar. 2009)

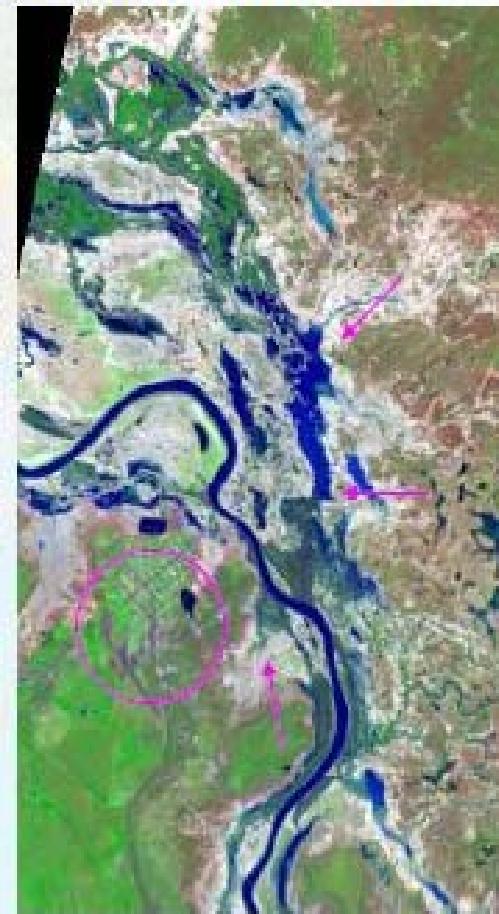

March 12, 2009
True-Color Image
EO-1 ALI Image

In this true-color image, note how the water color is so muddy that it makes discerning the extent of the flooding difficult.

March 12, 2009
False-Color Image
EO-1 ALI Flood Product

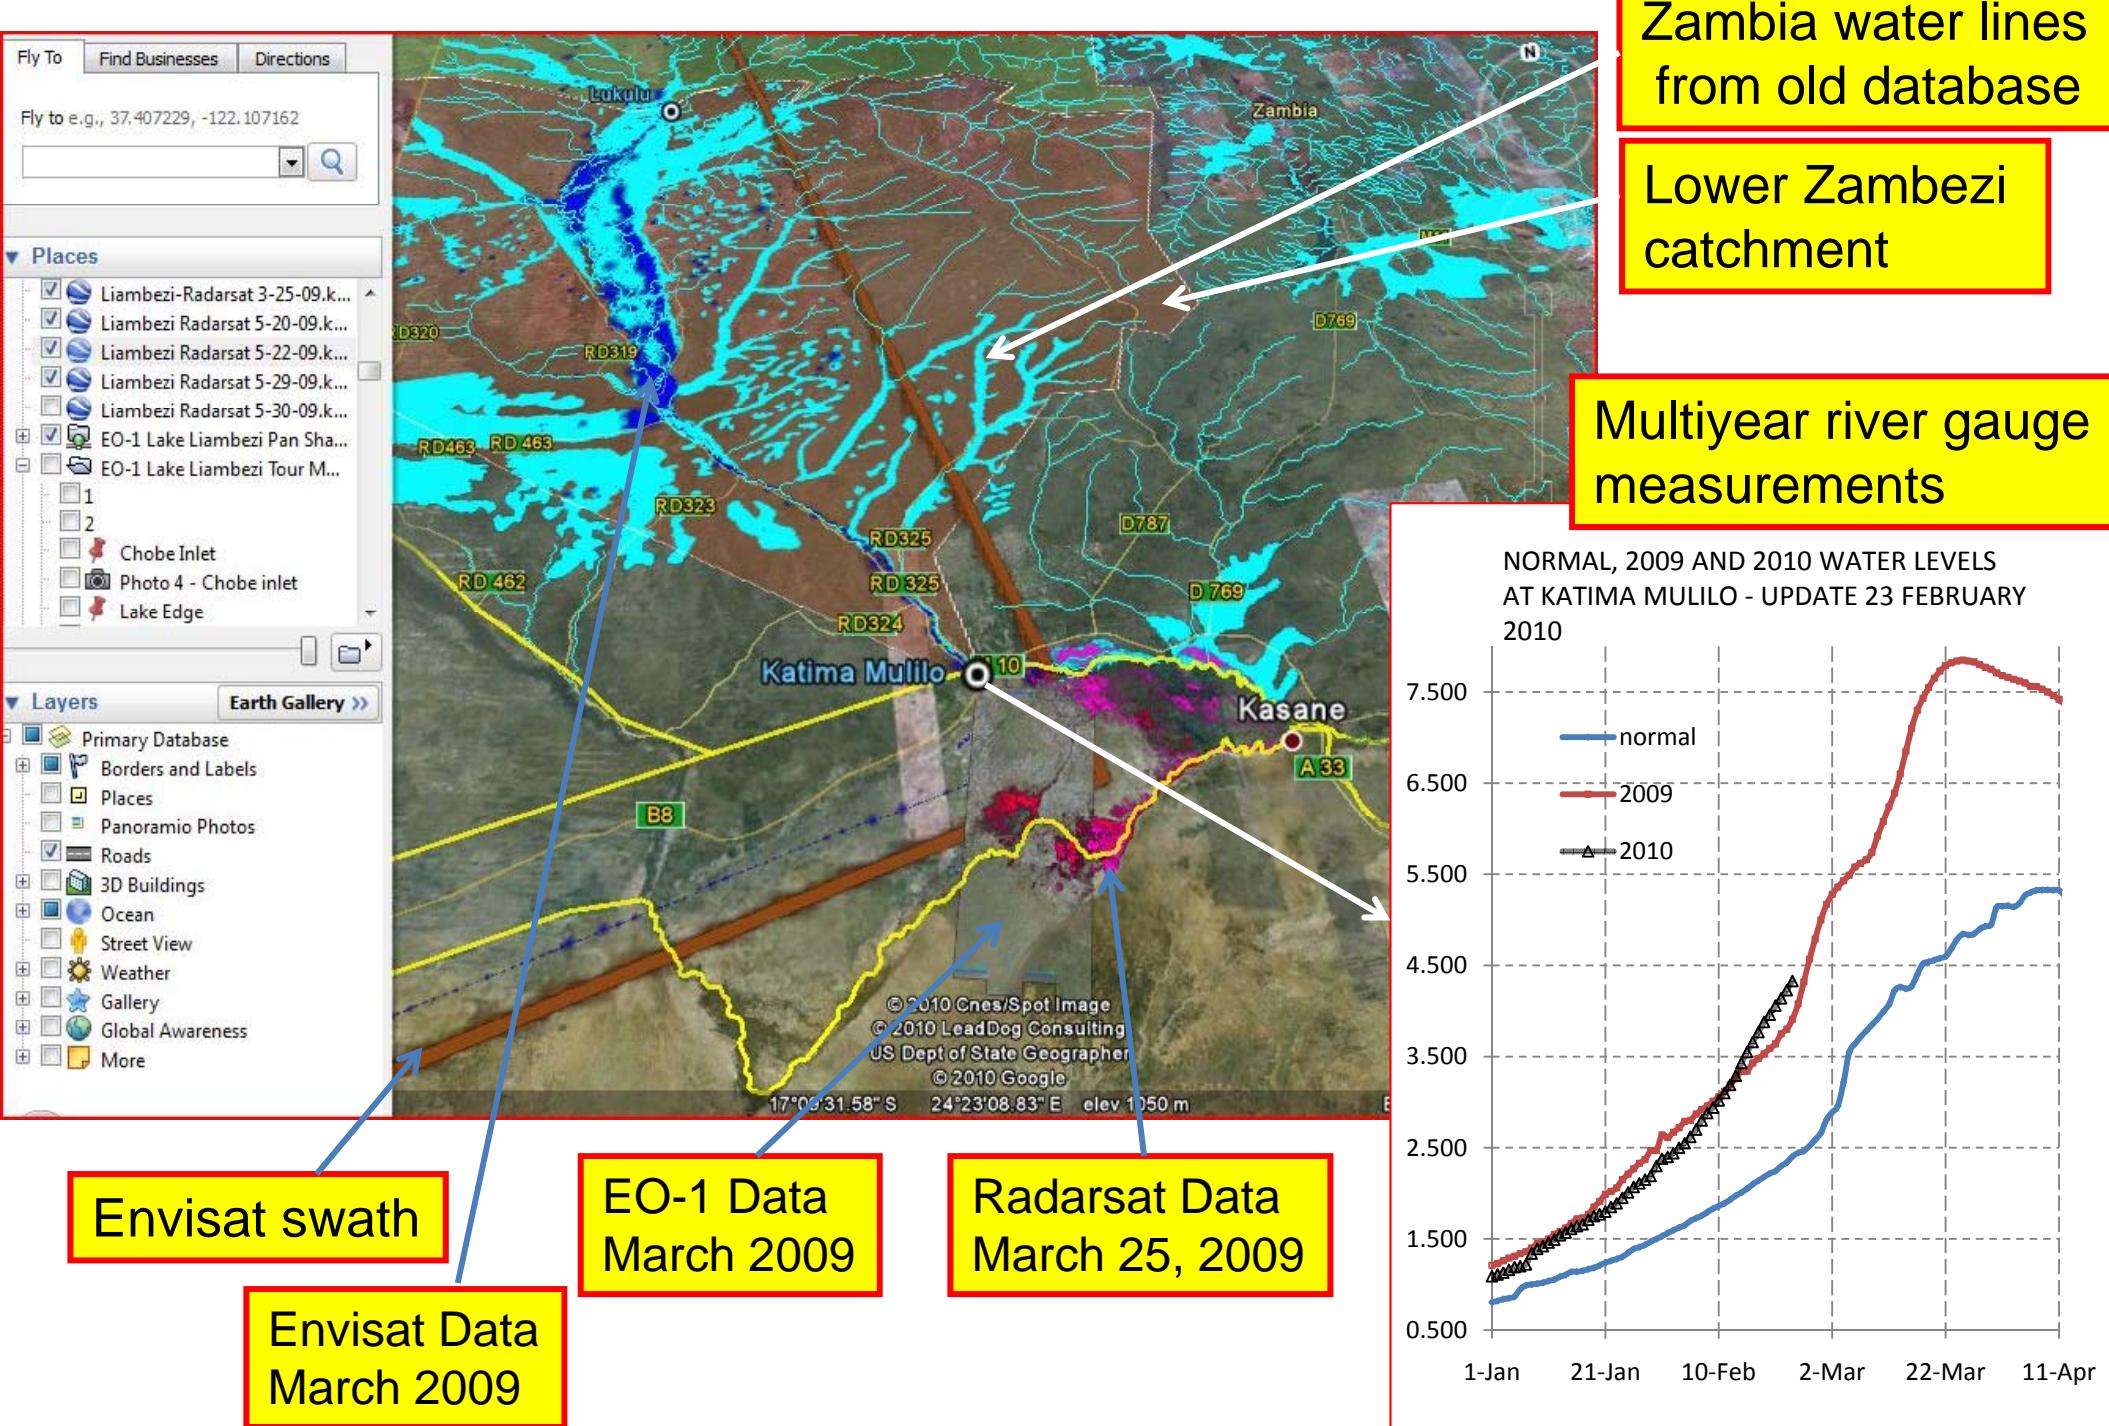

This false-color image combines infrared and visible light, which makes the extent of the flooding far more obvious. Water is dark blue, while plant-covered land is green, and bare earth is rosy tan.

March 25, 2009
False-Color Image
EO-1 ALI Flood Product

Two weeks later, the flood waters have receded even more, which the EO-1 Flood Product makes evident.

Sample Display of Multi-year Satellite Measurements (in month of March) of Katima Mulilo Linked to JRC Via Namibia Flood Mashup Based on Terra AMSR-E Microwave Instrument

GDACS Global Flood Detection System - Version 2

An experimental system to detect and map in near-real time major river floods based on daily passive microwave satellite observations. The purpose is to identify and measure floods with potential humanitarian consequences after they occur.

[Home](#) [Current floods](#) [Global map](#) [Search areas](#) [Custom areas](#) [Animations](#) [Download](#) [About](#)

Create a customize graph by parameter

You can create a custom graph combining up to 4 time series. In a given time period, you can compare different sites (e.g. upstream, midstream, downstream for flood propagation) and/or different years (e.g. comparison with last year's floods). Available parameters are: flood signal (ratio of brightness temperature of observation and nearby dry pixel), flood magnitude (signal anomaly expressed as standard deviation removed from the mean) and estimated flooded area (in km²).

Area Id: Colour: Legend:
Period: From To
Series: AreaId Year Colour Legend

In collaboration with: 

Sample Alert During Pilot

Namibia daily flood bulletin 03 March 2010:

There have again been heavy rains in parts of the Zambezi catchment. See attached NASA map. The waterlevels at Chavuma started rising again. See attached graph. Our forecast remains that the Katima Mulilo waterlevels are heading for 7 m by mid-March 2010. For perspective, the flood would be:

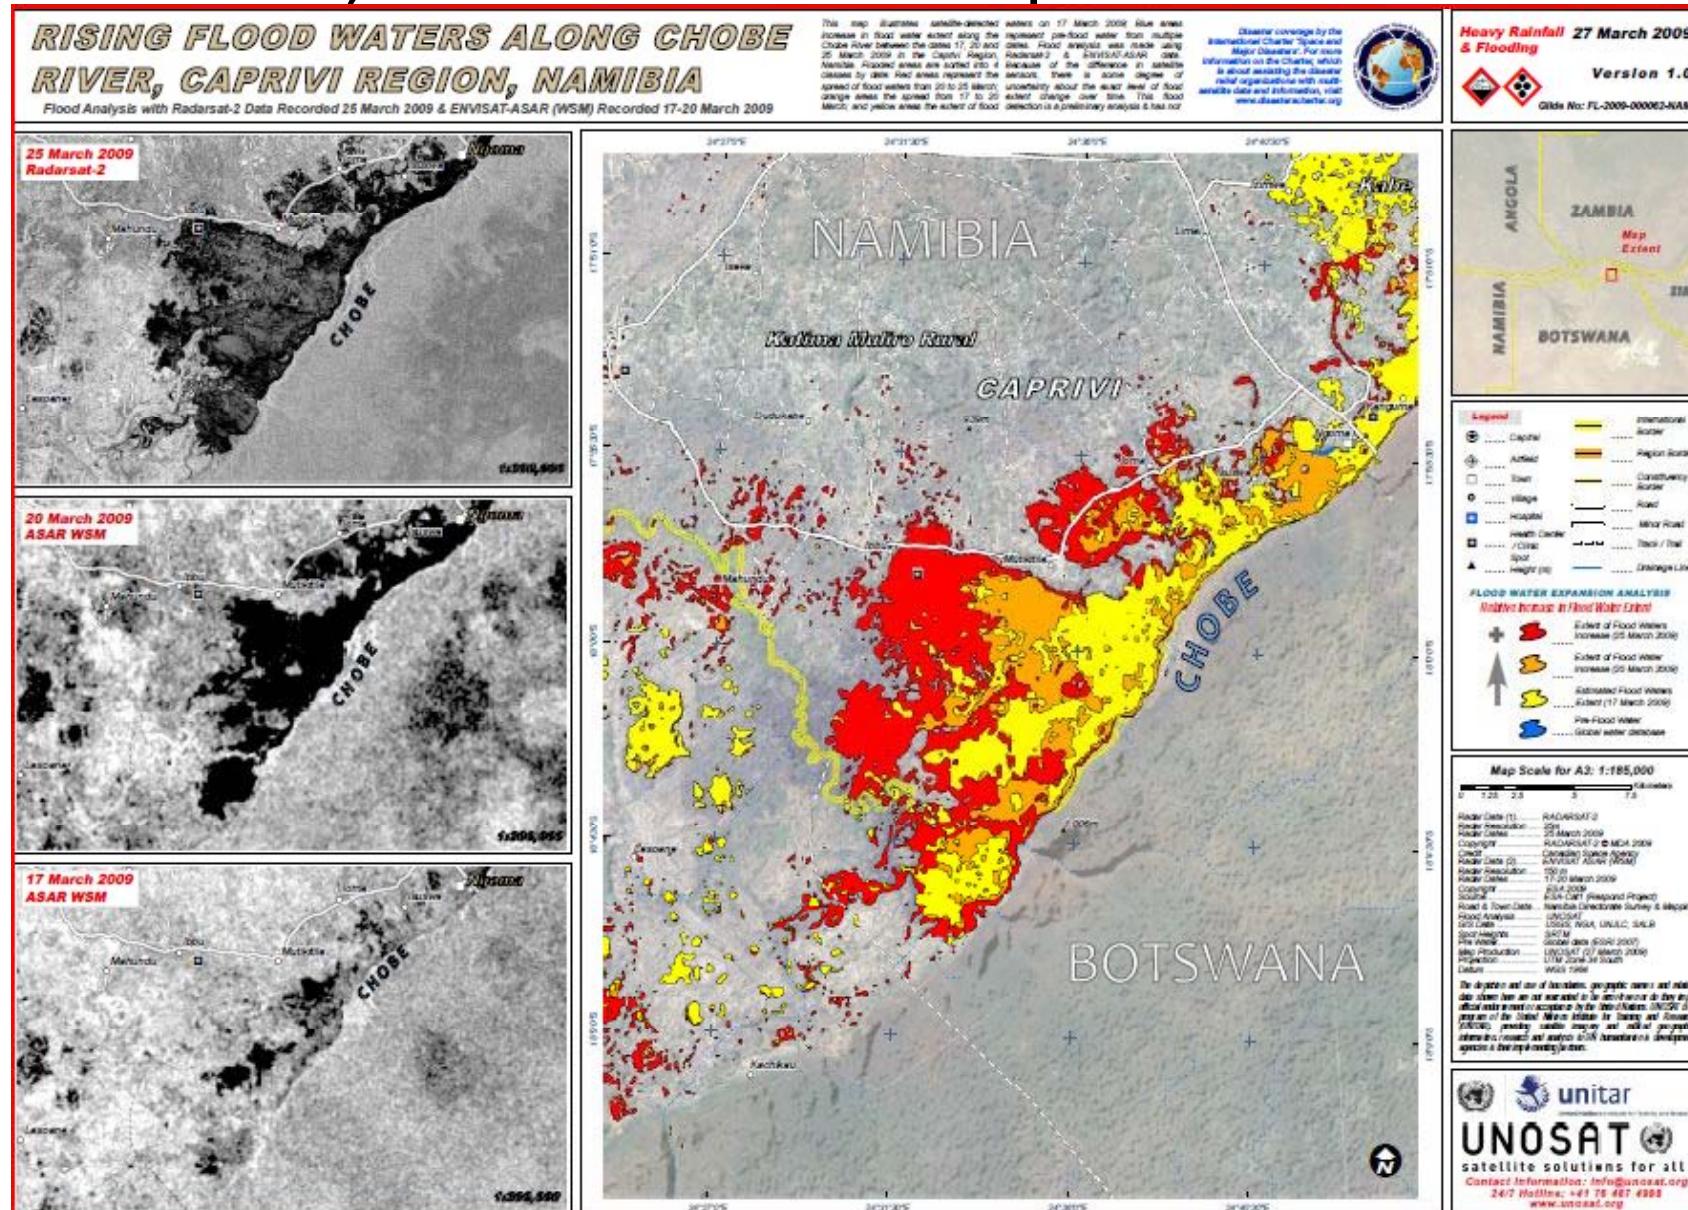

similar to 2007

higher than 2008

lower than 2009

But much will depend on the rains and the catchment response in the coming weeks.

Sample Time Sequence Flood Map Generated by Unosat, Derived from Multiple Satellite Data Sets

Vision is to generate similar product automatically when floods predicted and pair them with river gauge measurements

Conclusion

- Combining Sensorwebs with an elastic computation cloud enables surge capacity for disasters by enabling parallel processing of various algorithms and other processes within the cloud
- Elastic cloud provides work space for user to customize their experience instead of a preset outputs
